Lab 6019 - Cluster Usage Instructions

1. Master Node is System No. 24. This is also the NFS root.

2. You may use any other system for running your program. Each system
has a host name mpi<systemnumber>
For instance, the system 25 (the number on cpu/monitor) has a hostname
mpi25

3. Make sure that master node is up and running (Ubuntu) before you
start your system.

4. Login credentials are mpiuser:parcom

5. In each system, there is a folder /mirror/local, where you may put
your programs, compile and run locally.

6. To run on the cluster, move the executable file to a folder inside
/mirror/mpiuser. The datasets are to be maintained in a folder at any
location inside /mirror/mpiuser.

7. Please note that /mirror/mpiuser is shared - hence it is not
advised to put any code in that location.

8. Do NOT delete any other user's content from the shared directory -
if performed, it will be tracked to the user/system that performed
deletion.
